

Lesson 06

Production Environment

➔ Deployment on Python Anywhere

1. Using the project and the data model used in the past lesson (Authors, Publishers and Books), let deploy it at Python Anywhere.
2. Create an account in Python Anywhere.
3. In Python Anywhere:
 - add a new web app;
 - select Django Web Framework and Python 3.7;
 - give it a name – the same of the project you already have to deploy;
 - in Files page, edit “`????_pythonanywhere_com_wsgi.py`” file and uncomment code lines below Django section;
 - try to run it.
4. Now you have two options to populate your project with the project you want to deploy:
 - You can add the files to the recent created web app in Python Anywhere – using the Files page;
 - OR you can use the Console page to use git tool to copy your project from a git repository.
5. Fine tune your project configurations.
